AUBERT&DUVAL

HIGH PERFORMANCE STEELSEOR TRANSMISSIONS SYSTEMS

www.aubertduval.com

Under the load: Mechanical stresses on gears and bearings

There are three main types of stress that occur when two gears come into contact:

Tooth Root

Defect: Tooth root breakage. Stress types: Pressure,

Tooth Flank

Close to surface (<100µm) **Defect:** Pitting, Micropitting, Scuffing. Stress types: Friction, kinematics, Pressure.

Subsurface and Core Contact fatique

Defect: Tooth flank breakage. Stress types: Bending.

In power transmission systems, there are two main families of components: gears and bearings. They are subjected to different types of stress, as illustrated below:

Bearing application

The loading of a ball in contact with a raceway provides tensile stresses that can be compensated by increasing the surface hardness and introducing of the compressive stresses.

Metallurgical solution

To answer to the increase of the Hertz pressure / applied bending stress, rolling contact fatigue and higher operating temperatures, there is a need to use treatment solutions that can push-back these stresses. Different material strategies:

- · Carburizing using high tempering steel
- · Steel grade optimized for deep nitriding
- · Duplex hardening alternative (carburizing + nitriding for surface distress)

Next-generation steels for transmissions

Typical Mechanical properties

	Tempering (°C)	YS0.2 Core (MPa)	UTS Core (MPa)	K1c Core (MPa.Vm)	Hardness surface (HV10)	Case depth Hvcore + 100 (mm)
GKH™ (33CrMoV12-9)	600°C	1060	1250	180	850	0.75
GKP [®] (32CrMoNiV5)	600°C	1280	1430	80	900	0.90
AD65N™ (30CrMoV13-15)	600°C	1280	1480	100	920	0.85

Different melting route (with or without remelting process) is possible depending on the desired final mechanical and fatigue properties

Nitriding thermochemical treatment

Capable of very deep nitriding with reduced time compared to current nitriding steels: due to the nature of the very fine microstructure and the precipitates, the kinetic of nitriding is better than standard nitriding steel.

The surface hardness and core strength are greater than those of current nitriding grades.

C65NiL[™] -**New carburizing** steel for gears & bearings

A new carburizing grade the C65NIL[™] has been developed by Aubert&Duval with an original metallurgical design based on M50NIL alloy, with a higher content of Molybdenum, Vanadium and Cobalt to increase surface hardness.

C65NiL[™] is in the low Co family (<8%) and makes it possible to achieve a hardness level of more than 825 HV (about 65 HRC) after thermochemical and heat treatments with a toughness level comparable to the reference grade M50NIL.

	UTS Core (MPa)	K1c Core (MPa√m)	CHARPY V-NOTCH KV (Joules)	Surface Hardness after Carb. HV10		
M50NIL	1400	65	30	> 720		
C65NIL™	1600	40	10	> 850		

0

AD65N[™] - Nitriding steel

AD65N is a new 3% Chromium nitriding steel with slightly adjusted chemical composition in comparison with the common 33CrMoV12-9 steel and an excellent compromise between strenght and toughness.

Comparison of hardness profil between AD65N™ and 33CrMoV12-9 grade after deep nitriding (Nitriding temperature: ≈ 550°C - Duration : ≈ 120 hours.)

Comparison of hardness profil between M50NIL and C65NIL[™] grade after carburizing

Power in motion : Steels that drive performance

Since 1907 Aubert & Duval has been a recognized leader in the development of high-performance steels, working hand in hand with its clients from the earliest stages of material selection. We specialize in designing and manufacturing tailor-made steel grades that meet the most demanding requirements in sectors where reliability, precision and performance are non-negotiable.

A transmission system is a heart of mechanical energy management and have two functions: transferring mechanical power to wherever it is required and transmitting the motion from one component to another. To achieve this objective, even under the most severe conditions, it is essential that the components are produced from the finest materials available.

Aubert & Duval has a proven track record in the development of transmission steels, dating back to 1970 when the GKH™ grade was introduced. Since then, we have worked with our customers to invent new alloys, such as AD65N[™] and C65NiL[™] which will meet the needs of next generation transmissions systems.

Our aim is to achieve excellence in each of your components—because performance starts with the right material.
